SN54184, SN74184 BCD-TO-BINARY CONVERTERS SN54185A, SN74185A BINARY-TO-BCD CONVERTERS

SN54184, SN54185A ... J OR W PACKAGE
SN74184, SN74185A ... J OR N PACKAGE
(TOP VIEW)

description

These monolithic converters are derived from the custom MSI 256-bit read-only memories SN5488 and SN7488. Emitter connections are made to provide direct read-out of converted codes at outputs Y8 through Y1 as shown in the function tables. These converters demonstrate the versatility of a read-only memory in that an unlimited number of reference tables or conversion tables may be built into a system using economical, customized read-only memories. Both of these converters comprehend that the least significant bits (LSB) of the binary and BCD codes are logically equal, and in each case the LSB bypasses the converter as illustrated in the typical applications. This means that a 6-bit converter is produced in each case. Both devices are cascadable to N bits.

An overriding enable input is provided on each converter which, when taken high, inhibits the function, causing all outputs to go high. For this reason, and to minimize power consumption, unused outputs Y7 and Y8 of the '185A and all "don't care" conditions of the '184 are programmed high. The outputs are of the open-collector type.

The SN54184 and SN54185A are characterized for operation over the full military temperature range of -55°C to 125°C ; the SN74184 and SN74185A are characterized for operation from 0°C to 70°C .

SN54184 and SN74184 BCD-to-binary converters

The 6-bit BCD-to-binary function of the SN54184 and SN74184 is analogous to the algorithm:

- Shift BCD number right one bit and examine each decade. Subtract three from each 4-bit decade containing a binary value greater than seven.
- Shift right, examine, and correct after each shift until the least significant decade contains a number smaller than eight and all other converted decades contain zeros.

TABLE I
SN54184, SN74184
PACKAGE COUNT AND DELAY TIMES
FOR BCD-TO-BINARY CONVERSION

INPUT (DECADES)	PACKAGES REQUIRED	TOTAL DELAY TIMES (ns)	
		TYP	MAX
2	2	56	80
3	6	140	200
4	11	196	280
5	19	280	400
6	28	364	520

In addition to BCD-to-binary conversion, the SN54184 and SN74184 are programmed to generate BCD 9's complement or BCD 10's complement. Again, in each case, one bit of the complement code is logically equal to one of the BCD bits; therefore, these complements can be produced on three lines. As outputs Y6, Y7, and Y8 are not required in the BCD-to-binary conversion, they are utilized to provide these complement codes as specified in the function table (following page, right) when the devices are connected as shown above the function table.

PRODUCTION DATA
This document contains information current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

8	H	H	L	L	L	L	L	L	L	H
9	H	H	L	L	H	L	L	L	L	L
ANY	X	X	X	X	X	H	H	H	H	H

H = high level, L = low level, X = irrelevant

NOTES: C. Input conditions other than those shown produce highs at outputs Y6, Y7, and Y8.

D. Outputs Y1 through Y5 are not used for BCD 9's or BCD 10's complement conversion.

[†]When these devices are used as complement converters, input E is used as a mode control. With this input low, the BCD 9's complement is generated; when it is high, the BCD 10's complement is generated.

TYPES SN54185A, SN74185A BCD-TO-BINARY AND BINARY-TO-BCD CONVERTERS

SN54185A and SN74185A binary-to-BCD converters

The function performed by these 6-bit binary-to-BCD converters is analogous to the algorithm:

- a. Examine the three most significant bits. If the sum is greater than four, add three and shift left one bit.
- b. Examine each BCD decade. If the sum is greater than four, add three and shift left one bit.
- c. Repeat step b until the least-significant binary bit is in the least-significant BCD location.
